

HELPFUL TIPS FROM GRIFFIN DENTAL LAB

Intraoral Scanning Advantages for Your Practice!

As technology advances for modern dental practices, intraoral scanners have become a crucial component in the overall improvement of the patient experience. Clinicians, once trained, can complete a full-mouth scan in 3-5 minutes! The high resolution, 3D images are available immediately, making it much easier to engage with the patient about general oral health, education, and treatment plans, if needed. The reduced chair-time also allows you to see more patients overall.

These scanned images, or digital impressions, can be shared with us for high quality restorations/fabrications. Once complete, the images are stored and can be easily retrieved. If the patient loses the appliance or needs a second one for any reason, we can begin the process quickly without any extra visits from the patient!

Also, intraoral scanners provide much greater accuracy over standard impressions. There are no material costs (i.e., impression materials and lab stone).

In conclusion, these advantages will lead to a greater patient experience and quality of care. Griffin Dental Lab believes in this technology, and we look forward to strengthening our relationships with all our doctors and offices. If you would like more information, or a demonstration of the intraoral scanner, we would love to coordinate that for you!
